host, e.g. CHO, cells. The invention provides methods and materials related to expressing chimeric IgE proteins. Nucleic acid vectors, host cells, and methods for producing chimeric IgE polypeptides are provided. When administered to a mammal, the chimeric polypeptides can reduce the IgE antibody effects of IgE-related diseases such as asthma, allergies

The present sequence is the protein sequence of an opossum CH2-human CH3-opossum CH4 chimeric IgE polypeptide including a C-terminal polyhistidine sequence (OSO-H). A vector comprising DNA encoding OSO-H can be used for recombinant production this chimeric IgE in host, e.g. CHO, cells. The invention provides methods and materials related to expressing chimeric IgE proteins. Nucleic acid vectors, host cells, and methods for producing chimeric IgE polypeptides are provided. When administered to a mammal, the chimeric polypeptides can reduce the IgE antibody effects of IgE-related diseases such as asthma, allergies and eczema.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          188

The present sequence is the protein sequence of an opossum CH2-human CH3-opossum CH4-chimeric IgE polypeptide (modOSOSO). The coding sequence for modOSOSO contains point mutations in the human CH3 domains that abolish mast cell receptor binding. A vector comprising DNA encoding modOSOSO can be used for the recombinant production of the materials IgE in Nost, e.g. CHO, cells. The invention provides methods and materials related to expressing chimeric IgE proteins. Nucleic acid vectors, host cells, and methods for producing chimeric IgE polypeptides can reduce the IgE antibody effects of IgE-related diseases such as asthma, allergies and eczema.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       New host cell comprising a nucleic acid vector comprising a cytomegalovirus promoter, an Ig leader sequence or SV40 late polyadenylation sequence, useful in producing a chimeric IgE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LPPYTTRPKREGGQTFSLQSEVNITQGQMMSSNTYTCHVKHNGSIFEDSSRKCADSNPRG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a composition comprising a polypeptide and an aluminum compound, where the polypeptide comprises a self-igh polypeptide sequence (e.g. an ORO polypeptide or an OSO polypeptide. ADN00643, ADN00644, ADN00654, ADN00654, ADN00654, ADN00656, ADN00656, ADN00658, ADN00658, ADN00651, ADN00651, ADN00659, ADN00659, ADN00659 or level of detectable free IgE in the mammal. The composition is useful for inducing an anti self-ige antibody response in a mammal for treating or preventing allergies. The present sequence is an OSO protein, used to illustrate the invention. The OSO-H protein contains an opossum CH2 IgE domain followed by a human CH3 IgB domain followed by a nopossum CH4 IgE domain. The OSO-H protein also contains a C-terminal polyhistidine tag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NLFPYTTRPKREGGQTFSLOSEVNITQGQMMSSNTYTCHVKHNGSIFEDSSRKCADSNPR 128

ADN00656 standard; protein;

```
The present sequence is the protein sequence of an opossum CH2-human CH3-opossum CH2-human CH3-opossum CH4 (OSOSO) chimeric IgE polypeptide. A vector comprising DNA encoding OSOSO can be used for recombinant production of the chimeric IgE in host, e.g. CHO, cells. The invention provides methods and materials related to expressing chimeric IgE proteins. Nucleic acid vectors, host cells, and methods for producing chimeric IgE polypeptides are provided. When administered to a mammal, the chimeric polypeptides can reduce the IgE antibody effects of IgE-related diseases such as asthma, allergies and eczema.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LFPYTTRPKREGGQTFSLQSEVNITQGQWMSSNTYTCHVKHNGSIFEDSSRKCADSNPRG

The present sequence is the protein sequence of an opossum CH2-human CH3-opossum CH3-buman CH3-opossum CH4 chimeric IgE polypeptide including a C-terminal polyhistidine sequence (modoSoSo-H). The coding sequence for modoSoSo-H contains point mutations in the human CH3 domains that abolish mast cell receptor binding. A vector comprising DNA encoding modoSoSo-H combinant production of the chimeric IgE in host, e.g. CHO, cells. The invention provides methods and materials related to expressing chimeric IgE proteins. Nucleic acid vectors, host cells, and methods for producing chimeric IgE polypeptides are provided. When administered to a mammal, the chimeric polypeptides can reduce the IgE antibody effects of IgE-related diseases such as asthma, allergies and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 225 IDIPESGPUTIIPPTVKLFHSSCDPRGDAHSTIQLLCLVSGFSPAKVHVTWLVDGQEAEN 284

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a composition comprising a polypeptide and an aluminium compound, where the polypeptide comprises a self-IgE polypeptide sequence (e.g. an ORO polypeptide or an OSO polypeptide: ADN00654, ADN00654, ADN00654, ADN00654, ADN00656, ADN00656, ADN00651, ADN00651, ADN00651, ADN00656, ADN00658 or ADN00661). Administration of the composition to a mammal reduces the inducing an anti self-IgE antibody response in a mammal for treating or preventing an lergies. The present sequence is an OSO protein, used to illustrate the invention. The modOSOSO protein contains an opossum CH2 IGE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a human CH3 IgE domain followed by a label followed by a label followed by a label followed by a label followed by a label followed by a label followed by a label followed by a label followed by a label followed by a label followed by a label followed by a label followed by a label followed by a

                                                                                                                                                                                                                                  524
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the protein sequence of an opossum CH2-human CH3-opossum CH4-chiman CH3-opossum CH4 chimeric IgE polypeptide including a C-terminal polyhistidine sequence (OSSO-H). A vector comprising DNA encoding OSOSC-H can be used for recombinant production of OSOSC-H in host, e.g. CHO, cells. The invention provides methods and materials related to expressing chimeric IgE proteins. Nucleic acid vectors, host cells, and methods for producing chimeric IgE polypeptides are provided. When administered to a mammal, the chimeric polypeptides can reduce the IgE antibody effects of IgE-related diseases such as asthma, allergies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New host cell comprising a nucleic acid vector comprising a cytomegalovirus promoter, an Ig leader sequence, an insert sequence or SV40 late polyadenylation sequence, useful in producing a chimeric IgE polypeptide.

                                                                                                                                                                                                                                                                                           524
illustrate the invention. The OSOSO protein contains an opossum CH2 IgE domain followed by an opossum CH3 IgE domain followed by an opossum CH3 IgE domain followed by an opossum CH3 IgE domain followed by an opossum CH4 IgE domain. The OSOSO-H protein also contains a C-terminal polyhistidine tag.
                                                                                                            69
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present invention relates to a composition comprising a polypeptide an aluminium compound, where the polypeptide comprises a self-IgE

polypeptide sequence (e.g. an ORO polypeptide or an OSO polypeptide: ADN00643, ADN00656, ADN00656, ADN00658, ADN00651). Administration of the composition to a mammal reduces the level of detectable free IgE in the mammal. The composition is useful for inducing an anti self-IgE antibody response in a mammal for treating or preventing allegiles. The present sequence is an OSO procein, used to illustrate the invention. The medoSOSO-H protein contains an opossum CH2 IGE domain followed by a human CH3 IGE domain followed by an opossum CH2 IGE domain. The andOSOSO-H protein also contains point mutations in the human CH3 ide domain followed by an opossum CH4 IGE domain. The andOSOSO-H protein also contains point mutations in the terminal polyhistidine tag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     129

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                              The present invention relates to a composition comprising a polypeptide and an aluminium compound, where the polypeptide comprises a self-IgE polypeptide sequence (e.g. an ORO polypeptide comprises a self-IgE ADM06643, ADM06643, ADM06654, ADM06654, ADM06656, ADM06656, ADM06656, ADM06656, ADM06656, ADM06656, ADM06656, ADM06659 or ADM0661). Administration of the composition to a mammal reduces the invent of detectable free IgE in the mammal. The composition is useful for preventing allergies. The present sequence is H-OCO-H protein, used to preventing allergies. The H-OCO-H protein contains an opossum CH2 IgE domain. The H-OCO-H protein contains an opossum CH2 IgE domain. The H-OCO-H protein also contains a N- and C-terminal
                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                       120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                            The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2 and 4 of the opossum IgE and the heavy chain constant regions 1 from the dog. It was shown to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema.
